

Technical press release (TPR)

Supfina Grieshaber GmbH & Co. KG

The product is a further development

Photographic material can be requested: p.mich@supfina.com

The product is part of the principal range: Cutting machine tools

Supfina Multitool

The new Supfina Multitool is the advanced development of the Supfina 660/668 series and directly aimed at today's customer requirements.

The Multitool is designed for small shafts with a maximum length of 700 mm and therefore, especially suitable for superfinishing camshafts, transmission shafts, balance shafts or even eccentric shafts between centers. With its small overall dimensions, the machine can be transported in one piece. In order to minimize investment and operation costs, the machine works are purely pneumatical and electrical without any hydraulic elements.

For the machining process, the user can choose between tape and stone tools. With our newly developed compact superfinishing units, directly adjacent machining points can be machined simultaneously. Alternatively, two-stage processes with different tool specifications can be carried out in just one clamping.

Additionally, a workpiece shuttle with loading position located outside the machining area is integrated. This reduces cycle time and allows for integration into all kinds of automation systems.
