

## Supfina – Technical press release

PI 203 –02/2009

### INDUSTRIE exhibition at Lyon, France

Wolfach, 06.02.2009 – **Supfina 722 LS** - shown at the INDUSTRIE exhibition in Lyon, France for the first time.

Supfina Grieshaber GmbH & Co. KG developed a new, modular designed machine concept for the superfinishing of steering racks, meeting the high demands of our customers in the automotive industry. It allows for the economic production of steering racks for hydraulic, electro-hydraulic and purely electrical power steering systems with the same basic machine. The different surface finishing operations of a steering rack can either be split up in several machining stations or – if the process parameters and cycle time allow – be combined in one station. The Supfina 722 LS allows for descaling of steering racks, finishing of the outer diameter with cross hatch or axial pattern, polishing of the Y flats or the ball thread. With the integrated automation via pallet loader or walking beam, the single, highly accessible machining stations can easily be linked. A small footprint and easy maintenance are combined with good ergonomics and excellent visibility. Cycle times < 20 seconds can be realised with most of our processes and guarantee a highly economic superfinishing of the newest generation of steering racks.

Come and meet us from March 10<sup>th</sup> till 13<sup>th</sup>, 2009 at the INDUSTRIE exhibition in Lyon, France, **hall 6, booth 66A119!**
